

CHANCE
Back to an active life...

PROLASYS® – Prostate Laser Therapy

Nowadays, almost every other man over the age of 60 suffers from benign prostate enlargement (benign prostatic hyperplasia = BPH). This is a benign swelling of the prostate gland. The problems caused when urinating are often trying and limit one's freedom and quality of life. Conventional treatments are not always effective. In addition, they are often painful and accompanied by complications.

Up to now, when searching for a suitable treatment, affected men could only choose between effective, invasive surgery and various heat therapies, which were safe, but not as effective.

PROLASYS® offers affected men the most modern, mildest, minimal invasive method of all prostate therapies:

The GreenLight Laser Therapy. This laser treatment was developed by leading urologic scientists from the US **MAYO Clinic** in co-operation with **Laserscope®**.

It is a simple and unique solution for prostate problems.

The **GreenLight PVP™** Laser Therapy (photoselective vaporisation of the prostate) combines the good treatment results of classic surgery (TURP) with the safety, convenience and ease of minimally invasive heat therapies.

Greenlight laser therapy is a prostate operation, which uses the newest, most innovative medical laser technology. For patients, this form of therapy means:

- A minimally invasive method of treatment with immediate elimination of discomfort and a very fast recovery
- Safe and effective treatment without appreciable side effects or any influence on sexual potency

The **GreenLight PVP™** is fast, effective, long lasting, with virtually no bleeding and hardly any pain. It can be conducted under local, as well as general anaesthesia.

Using the most modern video technology, the surgeon performs the treatment endoscopically – without an incision or bleeding. Most patients can leave the clinic on the following day, without pain, bleeding and free from agonising discomfort. A return to an active lifestyle is possible after only a few short days.

The chance to return to an active life.
